

Durcissement post-installation

[virtualisation](#), [VM](#), [Debian](#), [post-install](#), [durcissement](#)

Une fois l'installation d'un OS "de base" (voir [cette page](#)), et la configuration post-install (voir [cette page](#)) effectuées, nous allons appliquer le durcissement de l'OS.

Hooks APT

Afin de pouvoir repasser les partitions /boot et /usr en read / write, et la partition /tmp en exec lors de l'installation de nouveaux paquets ou lors de l'upgrade de l'OS, nous ajoutons des hooks pour APT.

Nous créons le fichier 00apt

```
# vi /etc/apt/apt.conf.d/00apt
```

Nous y ajoutons ceci

```
DPkg::Pre-Invoke {
    "mount -o remount,rw /boot";
    "mount -o remount,rw /usr";
    "mount -o remount,exec /tmp";
};

DPkg::Post-Invoke {
    "mount -o remount,ro /boot";
    "mount -o remount,ro /usr";
    "mount -o remount,noexec /tmp";
};
```

Fstab

Nous éditons le fichier fstab

```
# vi /etc/fstab
```

```
# /etc/fstab: static file system information.
#
# Use 'blkid' to print the universally unique identifier for a
# device; this may be used with UUID= as a more robust way to name devices
# that works even if disks are added and removed. See fstab(5).
#
# <file system>                  <mount point>   <type>   <options>
<dump>  <pass>
/dev/mapper/vg_sys-lv_root        /           btrfs   defaults
0          0
# /boot was on /dev/sda1 during installation
```

UUID=8077782c-de8c-4850-88ca-d93a1b706979	/boot	ext4
ro, nodev, nosuid, noexec	0	2
/dev/mapper/vg_sys-lv_tmp		/tmp
relatime, nodev, nosuid, noexec	0	0
/dev/mapper/vg_sys-lv_usr		/usr
0 0		btrfs ro, nodev
/dev/mapper/vg_sys-lv_log		/var/log
nodev, nosuid, noexec	0	0
/dev/mapper/vg_sys-lv_audit		/var/log/audit
nodev, nosuid, noexec	0	0
/tmp		/var/tmp
rw, noexec, nosuid, nodev, bind	0	0
/dev/mapper/vg_sys-lv_swap		none
0 0		swap sw
